READ THESE INSTRUCTIONS FIRST

Write your Centre number, candidate number and name in the spaces at the top of this page.

Write in dark blue or black pen.

You may use an HB pencil for any diagrams or graphs.

Do not use staples, paper clips, glue or correction fluid.

DO NOT WRITE IN ANY BARCODES.

Answer all the questions.

Give non-exact numerical answers correct to 3 significant figures, or 1 decimal place in the case of angles in degrees, unless a different level of accuracy is specified in the question.

Where a numerical value is necessary, take the acceleration due to gravity to be $10 \, \text{m s}^{-2}$.

The use of a calculator is expected, where appropriate.

Results obtained solely from a graphic calculator, without supporting working or reasoning, will not receive credit.

You are reminded of the need for clear presentation in your answers.

At the end of the examination, fasten all your work securely together.

The number of marks is given in brackets [] at the end of each question or part question.

A uniform smooth disc with centre O and radius a is fixed at the point D on a horizontal surface. A uniform rod of length 3a and weight W rests on the disc with its end A in contact with a rough vertical wall. The rod and the disc lie in a vertical plane that is perpendicular to the wall. The wall meets the horizontal surface at the point E such that AE = a and $ED = \frac{5}{4}a$. A particle of weight kW is hung from the rod at E (see diagram). The coefficient of friction between the rod and the wall is $\frac{1}{8}$ and the system is in limiting equilibrium. Find the value of E.

4

Three identical uniform discs, A, B and C, each have mass m and radius a. They are joined together by uniform rods, each of which has mass $\frac{1}{3}m$ and length 2a. The discs lie in the same plane and their centres form the vertices of an equilateral triangle of side 4a. Each rod has one end rigidly attached to the circumference of a disc and the other end rigidly attached to the circumference of an adjacent disc, so that the rod lies along the line joining the centres of the two discs (see diagram).

A particle of mass m is attached to one end of a light inextensible string of length a. The other end of the string is attached to a fixed point O. The point A is such that OA = a and OA makes an angle α with the upward vertical through O. The particle is held at A and then projected downwards with speed $\sqrt{(ag)}$ so that it begins to move in a vertical circle with centre O. There is a small smooth peg at the point B which is at the same horizontal level as O and at a distance $\frac{1}{3}a$ from O on the opposite side of O to A (see diagram).

(i) Show that, when the string first makes contact with the peg, the speed of the particle is

| $\sqrt{(ag(1+2\cos\alpha))}.$ |
|---|
| |
| |
| |
| |
| |
| |
| |

11 Answer only **one** of the following two alternatives.

EITHER

A particle P of mass 3m is attached to one end of a light elastic spring of natural length a and modulus of elasticity kmg. The other end of the spring is attached to a fixed point O on a smooth plane that is inclined to the horizontal at an angle α , where $\sin \alpha = \frac{2}{3}$. The system rests in equilibrium with P on the plane at the point E. The length of the spring in this position is $\frac{5}{4}a$.

A shop is supplied with large quantities of plant pots in packs of six. These pots can be damaged easily if they are not packed carefully. The manager of the shop is a statistician and he believes that the number of damaged pots in a pack of six has a binomial distribution. He chooses a random sample of 250 packs and records the numbers of damaged pots per pack. His results are shown in the following table.

| Number of damaged pots per pack (x) | 0 | 1 | 2 | 3 | 4 | 5 | 6 |
